

In the Claims:

1 1. (original) A plasticating screw for an extruder or
2 extrusion press having a high polymer melt through-put,
3 wherein the plasticating screw is received and rotatably
4 driven in a cylindrical barrel in order to transport the
5 admitted plasticatable polymer to an extruder nozzle
6 located at the other end, the polymer undergoing
7 plastication and being transported and mixed by a screw
8 channel formed by a first helically running flight, and
9 wherein in at least one region of the longitudinal extent
10 of the plasticating screw at least a second helically
11 running flight overlaps the first flight, characterised in
12 that the cross-sections of the at least two flights (4, 5)
13 in the overlapping region are reduced to such an extent
14 that their overall cross-section corresponds to the cross-
15 section of the first flight (4) immediately before the
16 overlapping region (7).

1 2. (original) A plasticating screw according to claim 1,
2 characterised in that in the region of the overlap the
3 width of the screw channel (2) is divided by the second
4 flight (5).

1 3. (original) A screw with changing flight according to claim
2 1, characterised in that after the start of the second
3 flight (5) the screw channel (2) continues in the direction
4 of flow of the material as a double screw channel.

Claims 4 to 7 (canceled).
